

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Appln. No. 09/472,958

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

- Sub B1*  
*AI*  
*Cont*
1. (original): A digital zoom-out apparatus for forming a zoomed-out image from a plurality of received image signals in accordance with a given magnification, the apparatus comprising:
    - an image signal storage unit which stores a plurality of frame or field image signals;
    - a motion information detector which detects motion information between two image signals; and
    - a record and control unit which zooms out the received frame or field image signals in accordance with the given magnification, receives motion information from said motion information detector, controls the location in said image signal storage where the zoomed-out image signals are to be recorded, and records zoomed-out image signals in said image signal storage unit,wherein the plurality of received frame or field images are zoomed-out and combined to form the zoomed-out image, which is synthesized according to a degree 15of overlap between the received images.

2. (original): The digital zoom-out apparatus of claim 1, wherein said motion information detector uses data provided by an accelerometer to detect the motion information.

- A1  
new*
3. (original): The digital zoom-out apparatus of claim 1, wherein said motion information detector uses data provided by a gyroscopic sensor to detect the motion information.
  4. (original): The digital zoom-out apparatus of claim 1, wherein said motion information detector compares a previously-received image signal with a currently-received image signal to detect said motion information.
  5. (original): The digital zoom-out apparatus of claim 1, wherein said record and control unit stores in said image signal unit only those portions of received images needed to form the zoomed-out image, whereby storage space is conserved by elimination of redundant information.
  6. (new): The digital zoom-out apparatus of claim 5, wherein redundant copies of duplicate portions of received images which overlap are not stored in said image signal unit by said record and control unit.
  7. (new): The digital zoom-out apparatus of claim 6, wherein when said record and control unit receives a new image signal which includes a duplicate portion overlapping with a previously-received image signal, the record and control unit maintains the duplicate portion from the previously-received image signal.

8. (new): The digital zoom-out apparatus of claim 6, wherein when said record and control unit receives a new image signal which includes a duplicate portion overlapping with a previously-received image signal, the record and control unit replaces the duplicate portion of the previously-received image signal with the duplicate portion of the new image signal.
9. (new): The digital zoom-out apparatus of claim 6, wherein when said record and control unit receives a new image signal which includes a duplicate portion overlapping with a previously-received image signal, the record and control unit stores an interpolation of the duplicate portion of the previously-received image signal and the duplicate portion of the new image signal.
10. (new): The digital zoom-out apparatus of claim 6, wherein non-overlapping portions of received images, needed to form the zoomed-out image, are stored in said image signal unit by said record and control unit.
